AI Enablement & Workflow Optimization Portfolio
Rachelle-Marie Tisdale

Healthcare Operations | AI Enablement | Process Improvement

About Me

Healthcare operations and business analysis professional with experience supporting complex, multi-system workflows in regulated environments. Skilled in process analysis, workflow optimization, and identifying opportunities for automation and AI-driven solutions to improve operational efficiency and service delivery.

Proven ability to translate complex operational challenges into structured insights, collaborate across cross-functional teams, and support data-driven decision-making. Currently pursuing a Master of Information Technology with a focus on data analytics, automation, and AI-enabled systems.

Particularly interested in leveraging AI, automation, and analytics to improve operational workflows and drive scalable business outcomes.

Project 1: AI Workflow Optimization in Healthcare Operations

Overview

Healthcare claims and eligibility workflows often span multiple systems, require manual intervention, and depend on cross-functional coordination. These factors frequently result in inefficiencies, delays, and inconsistent outcomes.

This project analyzes real-world workflow challenges and identifies opportunities to integrate AI-driven solutions to improve efficiency, accuracy, and scalability. This analysis reflects a practical approach to AI enablement by aligning real operational challenges with scalable, technology-driven solutions.

Problem

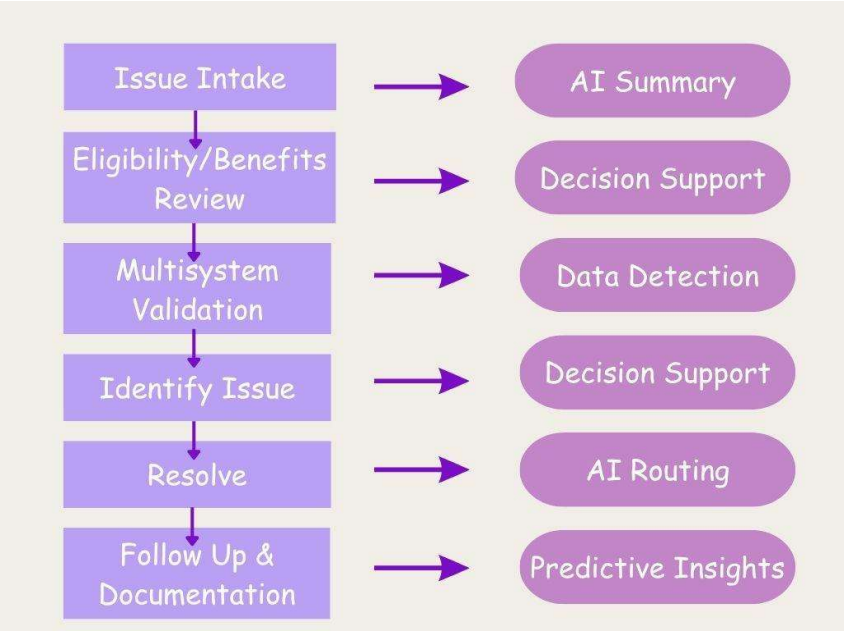
- Manual rework caused by inconsistent or incomplete data
- Delays between departments (claims, pharmacy, prior authorization)
- Limited visibility across systems and workflows
- Repetitive, manual tasks contributing to increased resolution time and operational inefficiency

Process Analysis

A typical workflow was mapped across the following stages:

1. Member issue intake
2. Eligibility and benefits review
3. Multi-system validation (claims, pharmacy, authorization)
4. Issue identification
5. Resolution or escalation
6. Follow-up and documentation

Workflow Analysis with AI Enablement Opportunities



This workflow illustrates key stages in healthcare operations, including claims and eligibility processing, as well as targeted opportunities for AI enablement to improve efficiency, accuracy, and decision-making throughout the lifecycle.

Key gaps identified:

- Redundant data entry and verification across systems
- Inconsistent or conflicting information between platforms
- High reliance on manual interpretation and decision-making
- Delayed communication and handoffs between teams

AI Enablement Opportunities

- **AI Case Summarization**
  Automatically generate concise summaries of member history and prior interactions to reduce review time
- **Intelligent Workflow Routing**
  Route cases to the appropriate department based on issue classification and historical patterns
- **Decision Support Tools**
  Recommend next best actions based on policy rules, historical outcomes, and contextual data
- **Data Discrepancy Detection**
  Identify and flag inconsistencies across systems in real time to reduce errors and rework

Proposed Impact

- Reduced average resolution time
- Improved data accuracy and consistency across systems
- Decreased manual workload and operational friction
- Enhanced member experience through faster, more reliable outcomes

These improvements support measurable gains in efficiency, accuracy, and overall service delivery performance.

Implementation Considerations

- Integration with existing healthcare platforms and workflows
- Compliance with HIPAA and data privacy requirements
- Change management, training, and user adoption strategies
- Scalability across departments and use cases

Project 2: Predictive Trends in Member Issues & Operational Bottlenecks

Overview

This project analyzes patterns in customer interactions and issue types to identify recurring trends and opportunities for predictive, data-driven decision-making. This analysis supports a shift from reactive issue resolution toward proactive, data-informed operational strategies.

Analysis

- Identified common issue categories across claims, eligibility, and authorization workflows
- Observed recurring delays and bottlenecks in resolution processes
- Analyzed patterns in issue frequency, complexity, and resolution timelines to identify opportunities for workflow optimization and predictive intervention

AI & Predictive Opportunities

- Anticipate high-volume issue types to improve resource allocation
- Identify potential delays before escalation occurs
- Enable proactive workflow adjustments instead of reactive issue handling

Proposed Impact

- Improved operational efficiency and throughput
- Faster resolution times and reduced backlog
- More balanced workload distribution across teams
- Enhanced decision-making through data-informed insights

Tools, Technologies & Analytical Capabilities

- Microsoft Excel (data analysis, reporting, trend identification)
- SQL (foundational knowledge)
- Power BI (foundational knowledge)
- Generative AI tools (use case development, workflow support, summarization, and analysis)
- Healthcare systems and multi-platform data environments

Next Steps

Expanding portfolio with additional projects focused on AI-enabled process improvement, analytics-driven decision-making, and workflow optimization within healthcare and regulated environments.

This portfolio reflects practical applications of workflow analysis and AI enablement concepts, grounded in real-world healthcare operations and workflow analysis experience.
